

Momentum Fuel System Regulator Troubleshooting

Step 1. Make sure the coolant system is full.

Step 2. Installers use the heater hose valve on the back of the engine when installing. Make sure it is open.

Step 3. If the valve is not open, open valve and run truck until you feel warm air coming out of the heater vents and the regulator should feel the same when touched.

Step 4. If steps 1 through 3 do not work, clamp off the hose going into the fuel system and flip the hoses on the IN and OUT connectors.

If none of the steps work have the tech working on it call David Obrien 210-846-5136 any time of the day.
